

# Understanding climate prediction and climate predicting operation in China

Jinjun Ji

Institute of Atmospheric Physics, CAS

Ragnan NZ

- I. Scientific bases of climate prediction
- II. Strategy of climate prediction
- III. climate prediction operation in China

# Forecasting time periods

< 2 weeks weather forecasting day by day

Monthly to seasonal monthly mean

Inter-annual

Inter-decadal

Climate projection

# Climate prediction

climate system is chaotic, prediction depends on **initial conditions**

effective predicting period  $\sim$  2 weeks

**for longer time**

to predict departure from climatic mean – **anomaly** , i.e. probability with changing range

# Is climate predictable?

**To depend on timescale of prediction**

Resource of climate predictability

- ‘inertia’ of climate variables
  - ‘long memory’
- Internal interaction and feedback of system
- response to external forcing

### a. Inertial memory

### b. Patterns of variability

### c. External forcing

# Internal multi-scale variability

seasonal MJO

interannual ENSO NAO IDO

inter-decadal NPO PDO IPO

climate abrupt change

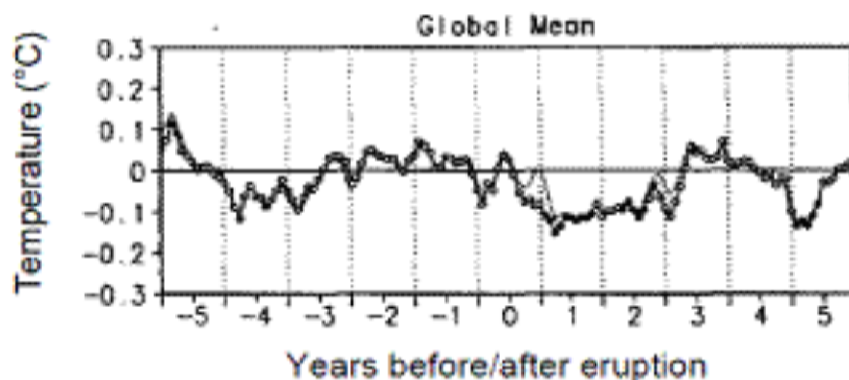

### a. Inertial memory

### b. Patterns of variability

### c. External forcing

# Southern Oscillation Indices

SOI: Tahiti - Darwin

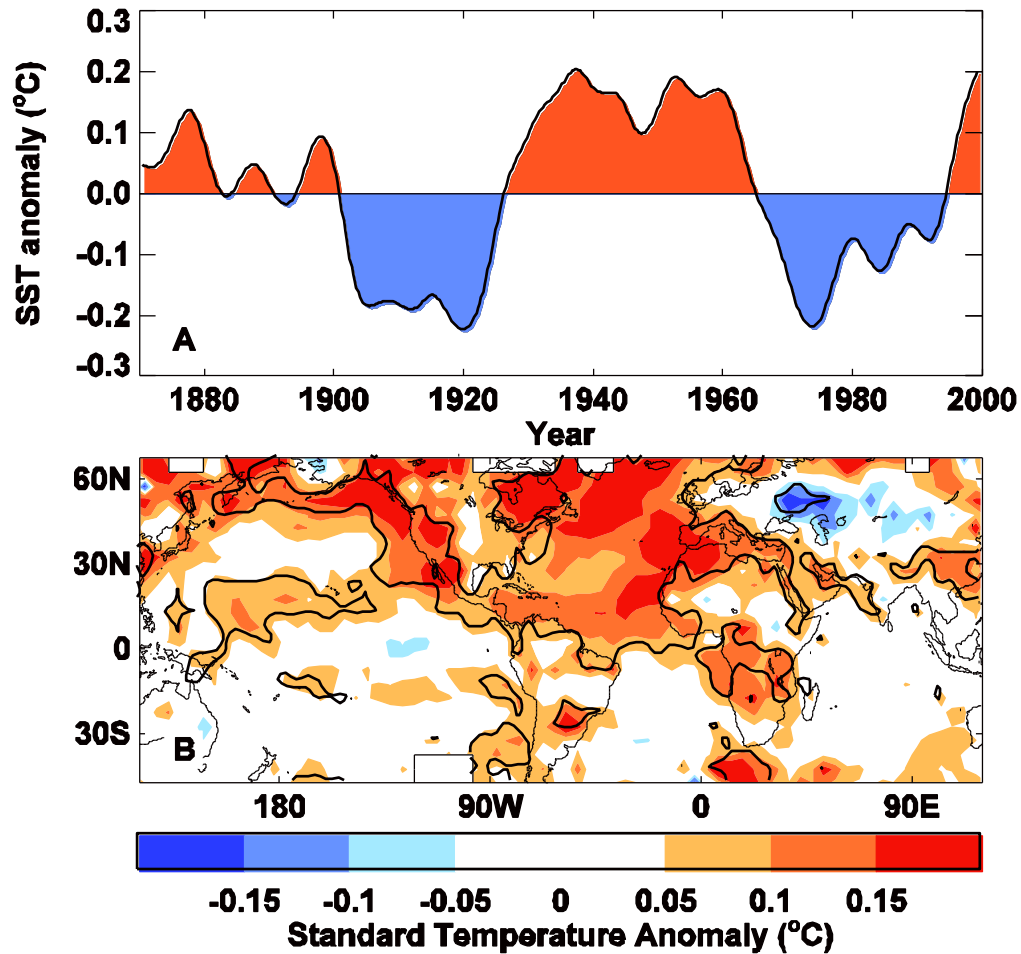

# North Atlantic Oscillation

# North Atlantic Oscillation

AMO (Atlantic Multi-decadal Oscillation) SSTA in N Atlantic (upper) , STA (lower)

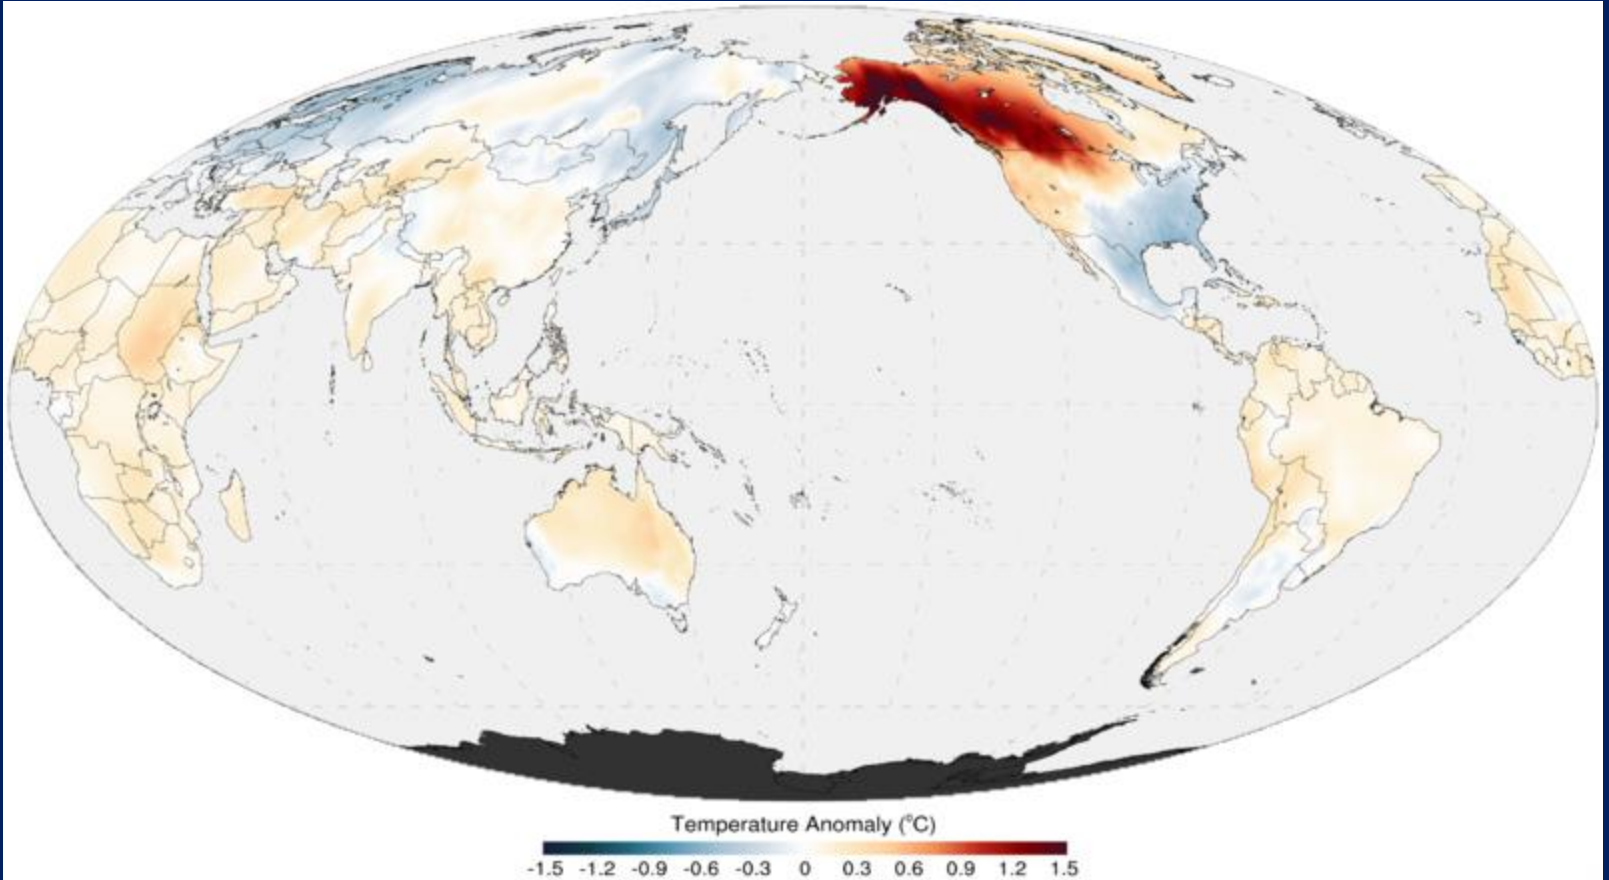

Pacific Decadal Oscillation

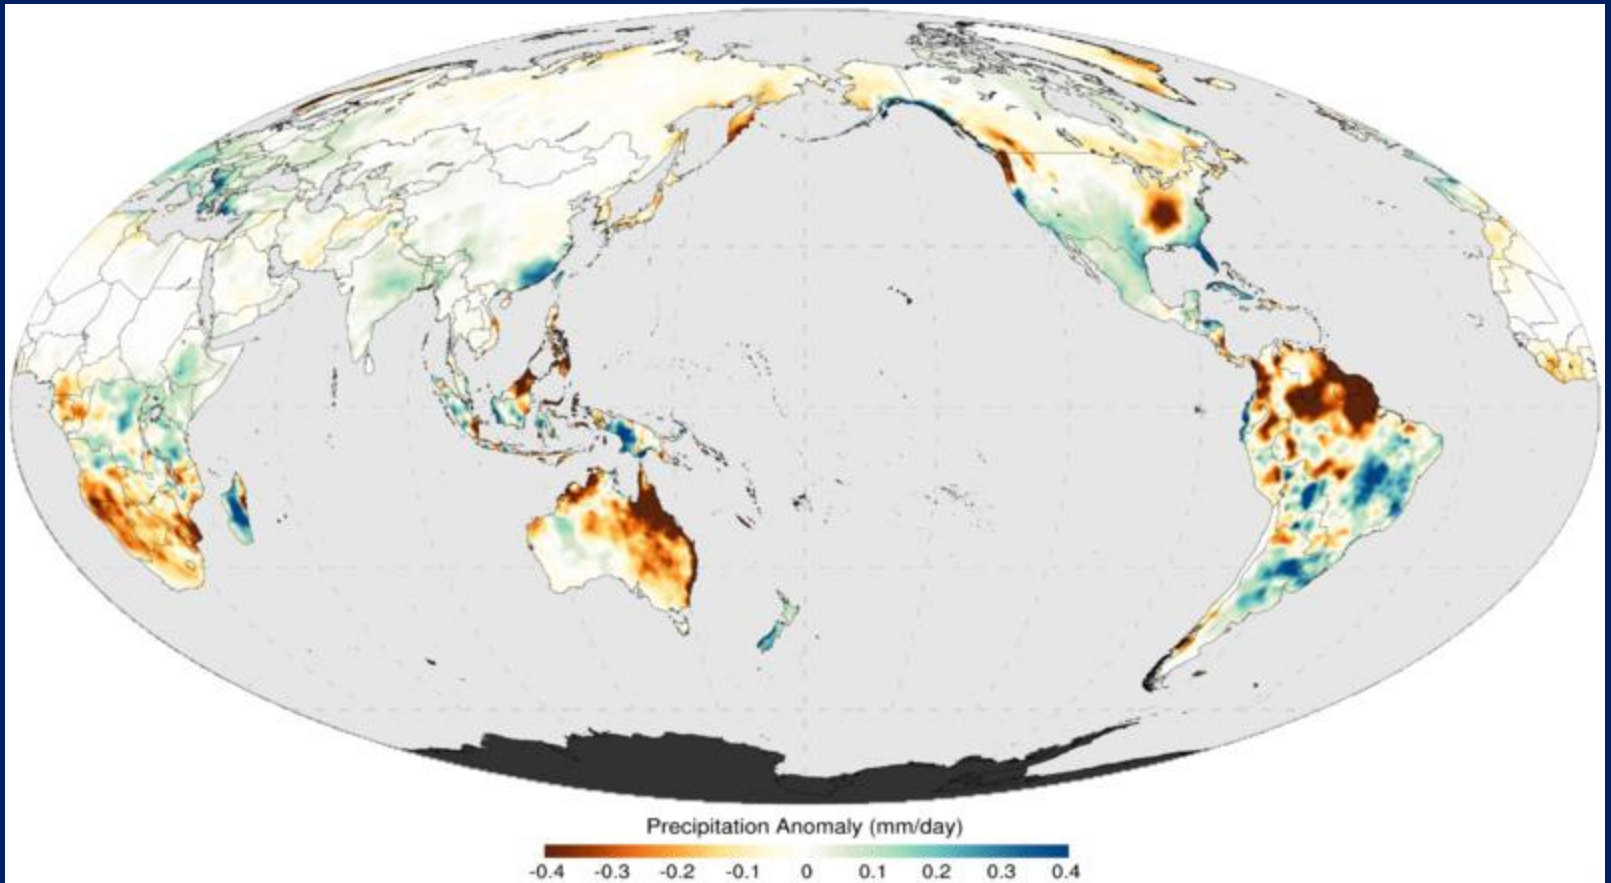

Temperature ( $^{\circ}\text{C sd}^{-1}$ )

# PDO index

# External forcing

For **seasonal –inter-annual** climate change

SST,

snow cover,

Soil moisture and temperature

.....

## For longer time scale

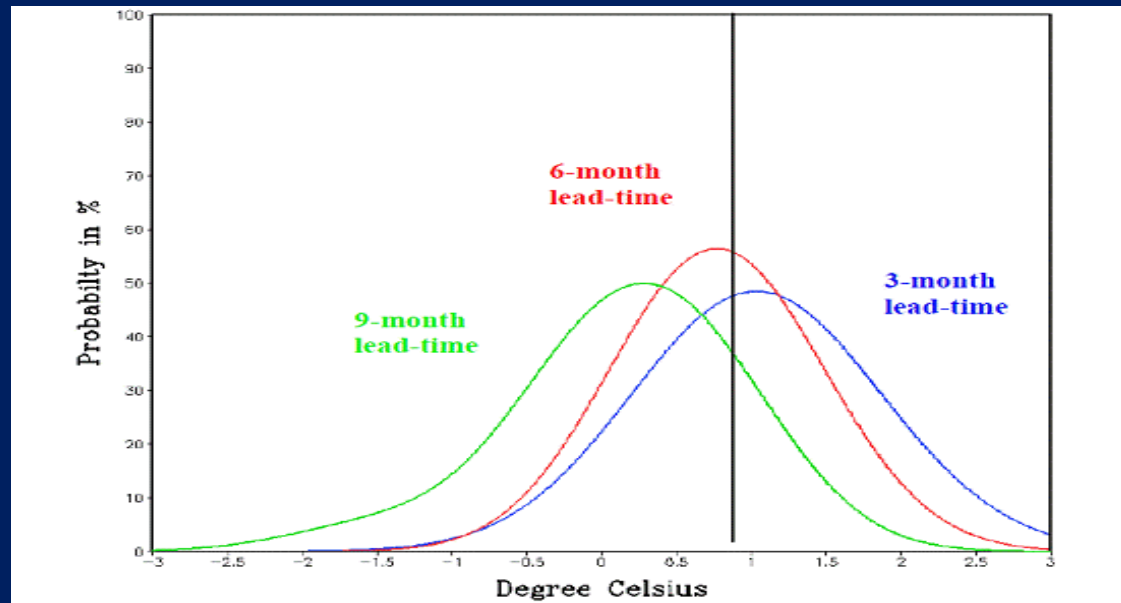

- Solar radiation
  - 11 22yrs sunspot cycles
- Lunar tidal 18.6yrs
- Volcano eruption
- Earth rotation rate ...
- Trace gas emission
- Land cover/land use

- climate system is high nonlinear system , climate prediction provides climatic probability (with uncertainty) in future.
- More understanding climate change , more predictable
- To assess climatic impacts must consider climatic uncertainty

# Strategy of climate prediction

Probability density function (PDF)

predictable signal / unpredictable noise

Nino 3,4 SST  
Predicting PDF

1. Statistic (based on long time series)

MGF(mean generate function),

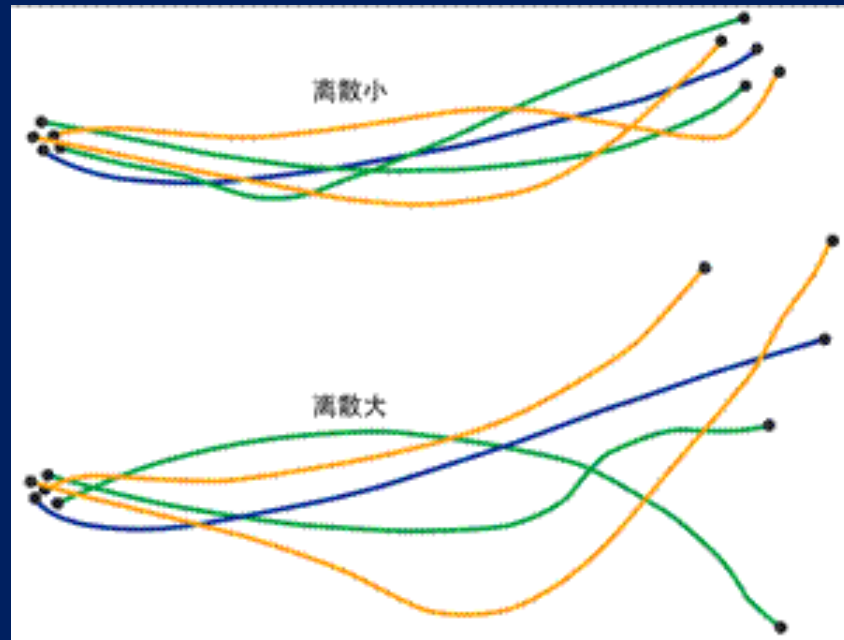

OSR(optimal subset regression),

EMD(empirical mode decomposition)

2. Stochastic dynamical model

3. Dynamic model

Prediction of dynamical model depend strongly on initial conditions

# Ensemble

One model with a set of random initial conditions

One model ensemble mean + corrections

ensemble skill related to system structure and geographical location

Multimodel ensemble (superensemble, MME)

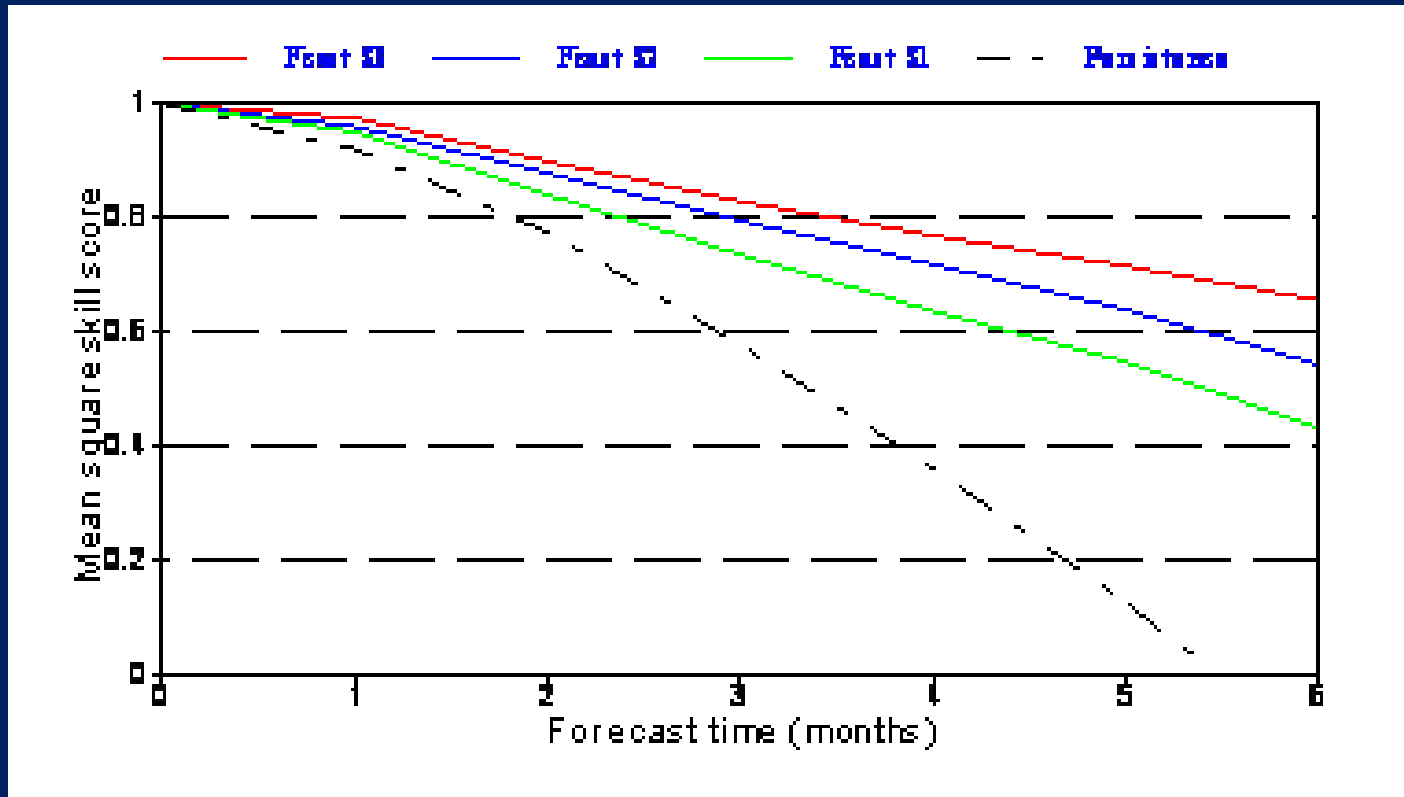

multi model

multi parameter

multi parameterization

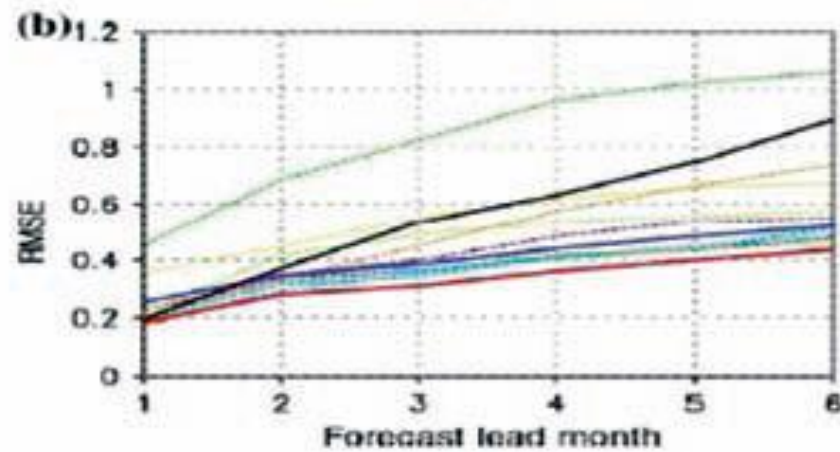

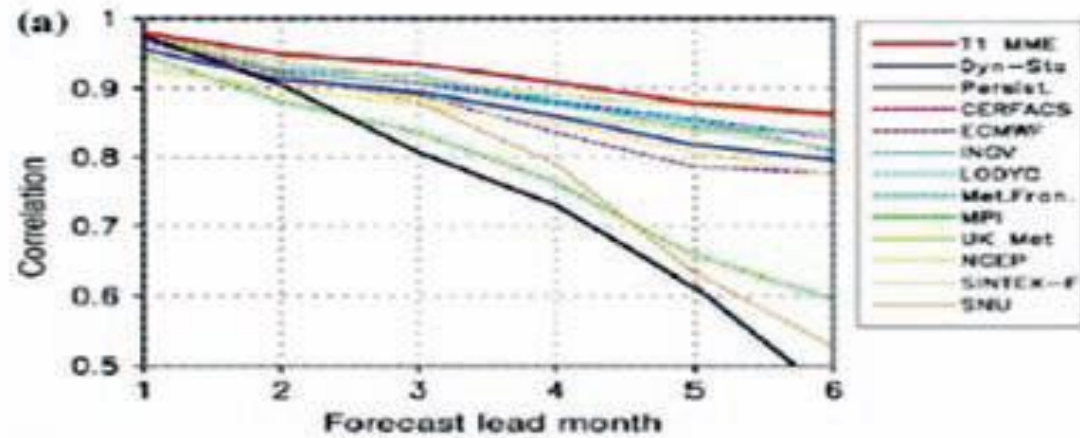

Ensemble predicting skill is higher than individual model prediction

MME higher one model ensemble

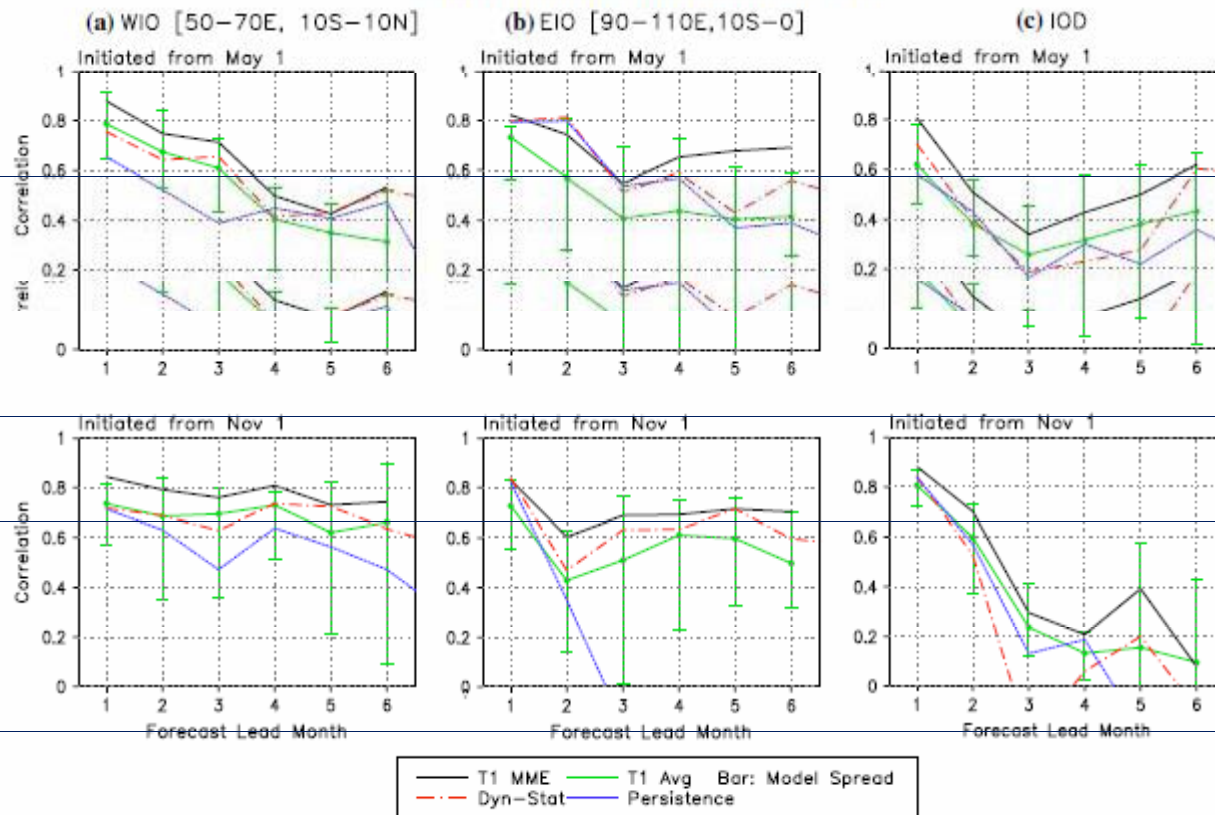

Mean square skill score for Nino 3,4 , ECMWF

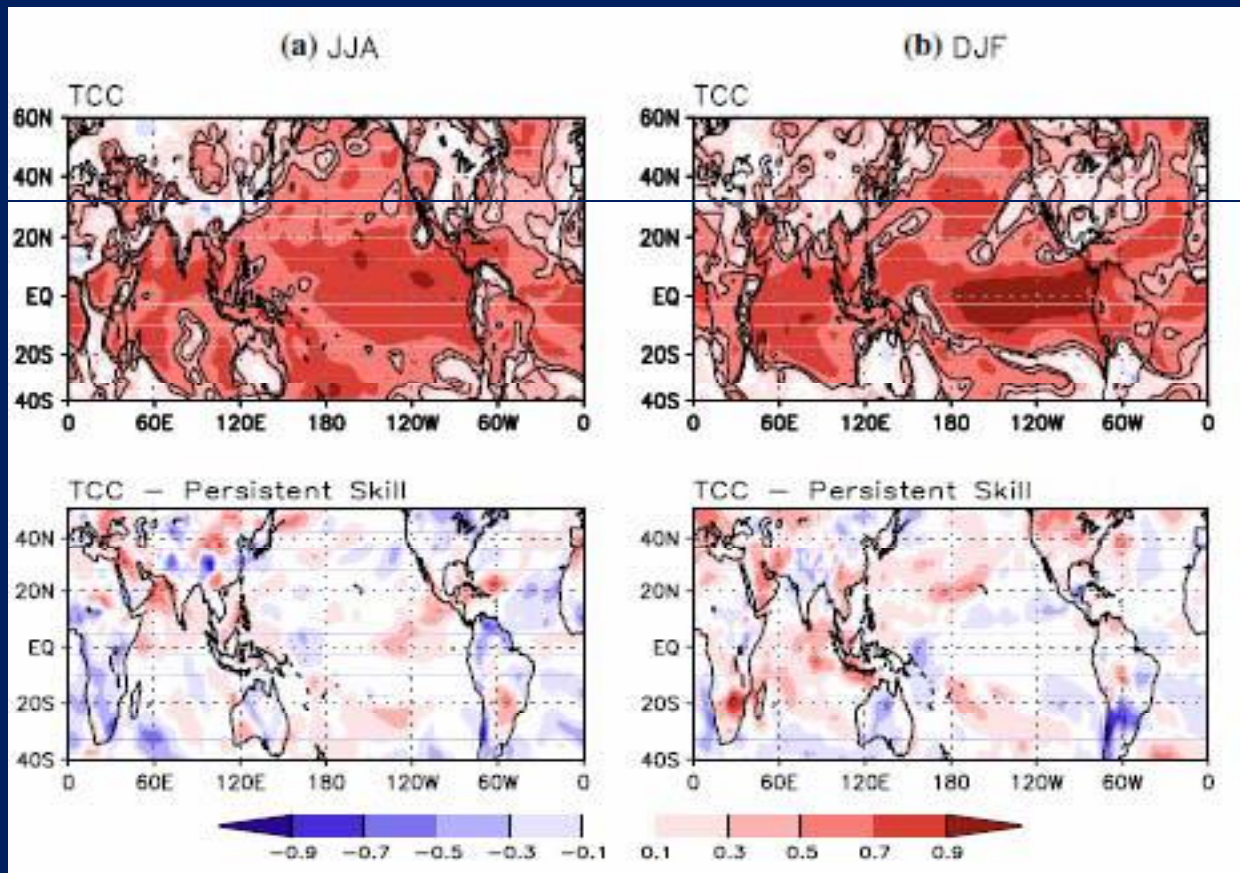

ENSO ensemble skill, red line: MME

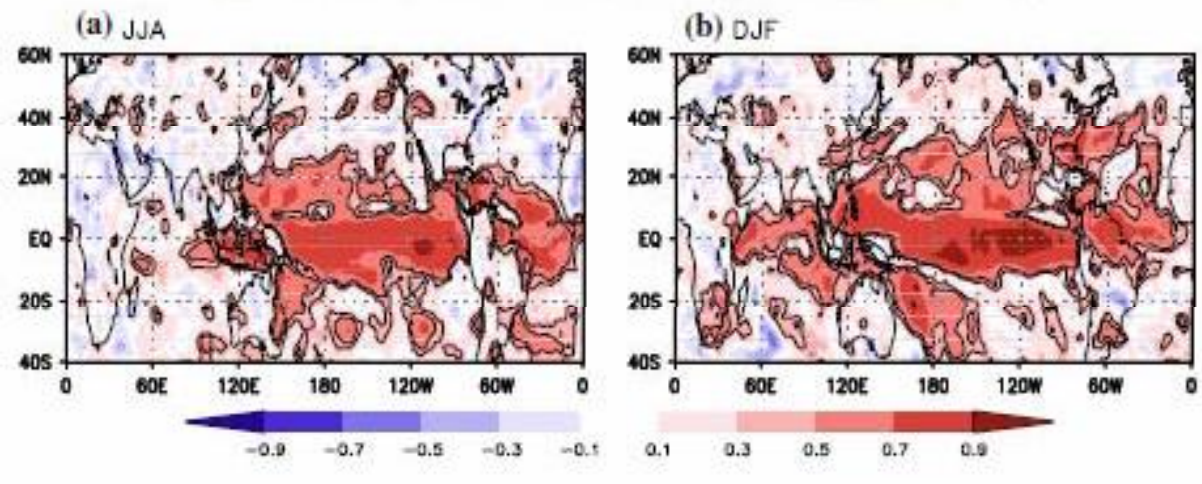

### Correlation Skill for Indian Ocean SSTA

1981-2003 APCC MME ensemble skill 2m Temperature

### APCC/CliPAS MME Skill for Precipitation (1981-2003)

## MME skill

Depend on seasons and regions

Related to ENSO highest

Indian Ocean high

Eastern Asia low

Tropic higher than mid-latitude

Temperature better than precipitation

# Climate prediction operation in China

1980's to start dynamic prediction tests  
in IAP

NCC Dynamic prediction operation  
started at the beginning of 21th century

## Monthly Forecast(Monthly "30 days" Forecast)

- runs at the end of each dekad
- 32 members of maximum ensemble size.
- The initial condition come from global atmospheric data assimilation of T213
- the boundary conditions are latest weekly persist SSTA
- Products:
  - circulation and factors in the 40 days of future

## Seasonal Forecast(Seasonal "90 days" Prediction)

### 1. by CGCM

Ensemble mean of 8 members:

Spring Forecast : issued at Feb. for MAM

Flood Season Forecast : issued at Mar. for JJA

Summer Forecast : issued at May. for JJA

Flood Season Supplement Forecast : issued at Jun. for JA & JAS

Autumn Forecast : issued at Aug. for SON

Annual Forecast : issued at Oct. for DJF & next MAM JJA

Winter Forecast : issued at Nov. for DJF

### 2. by RegCM for EastAsia

RegCM nested with CGCM

Flood Season Forecast : issued at Mar. for JJA

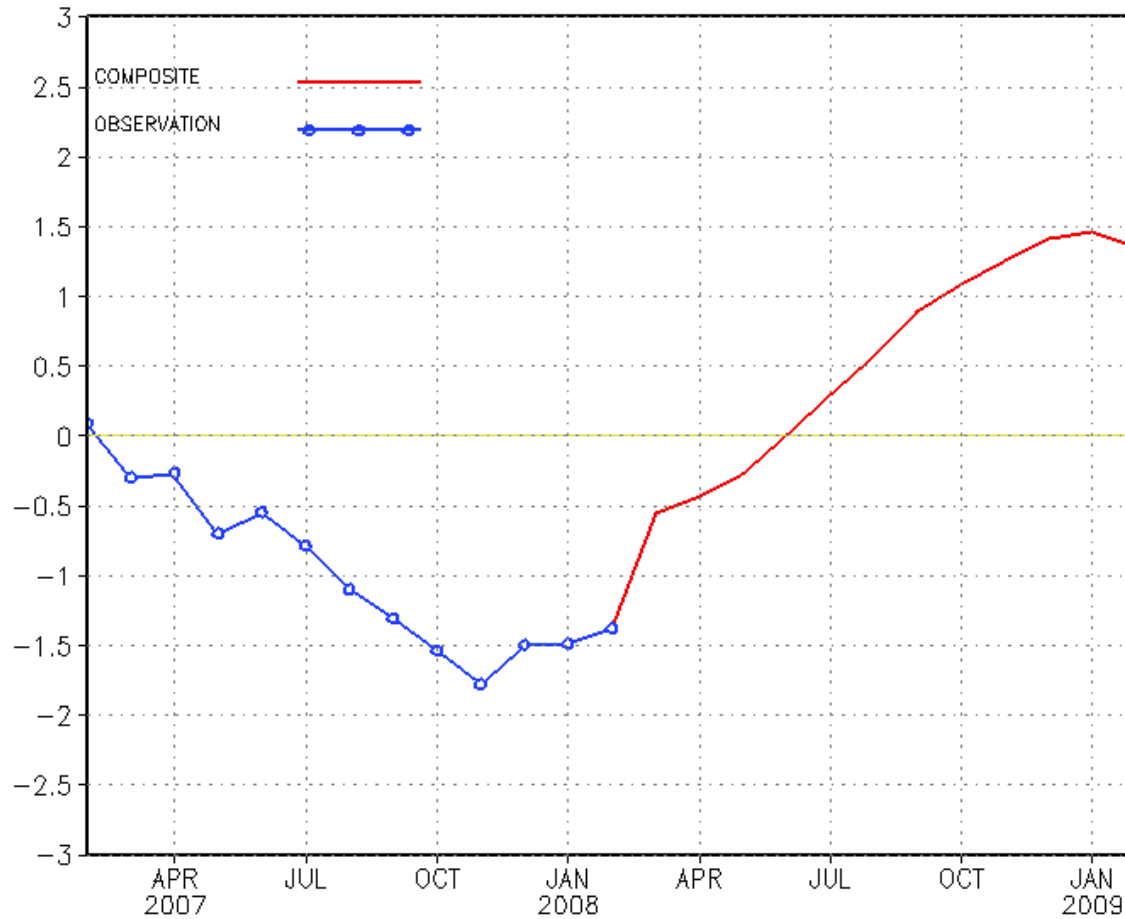

Annual Forecast : issued at Oct. for DJF & next MAM JJA

## **ENSO Prediction**

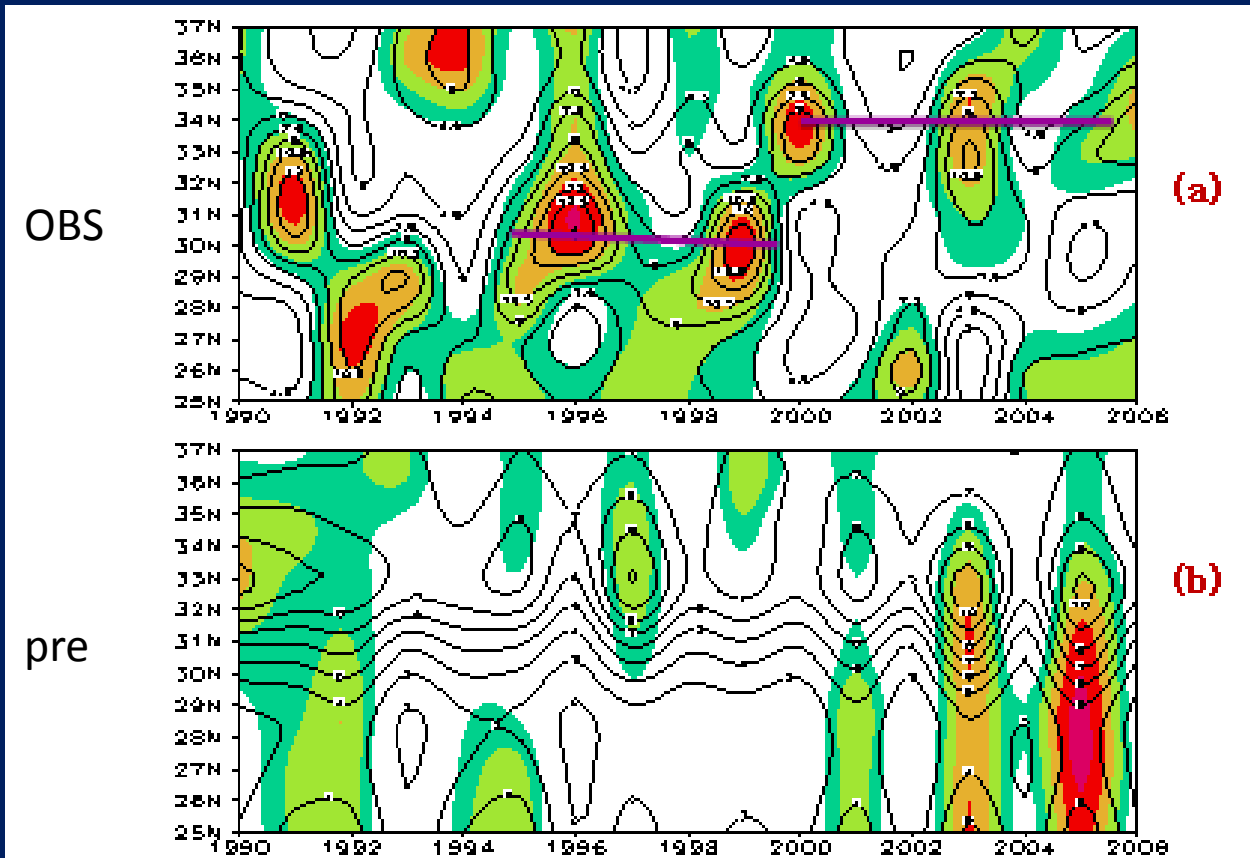

simplified ENSO model  
run at the end of each season , to predict  
the Nino3 Index of next 2-3 seasons

ENSEMBLE FORECASTED NINO3 SSTA FOR 2008-2009 BY THE COUPLED MODELS WITH THE LATEST 6 MONTHLY INITIAL FIELDS

Correlation coefficient between Obs. and predicted  
Mei-Yu rainfall. 1987-2006

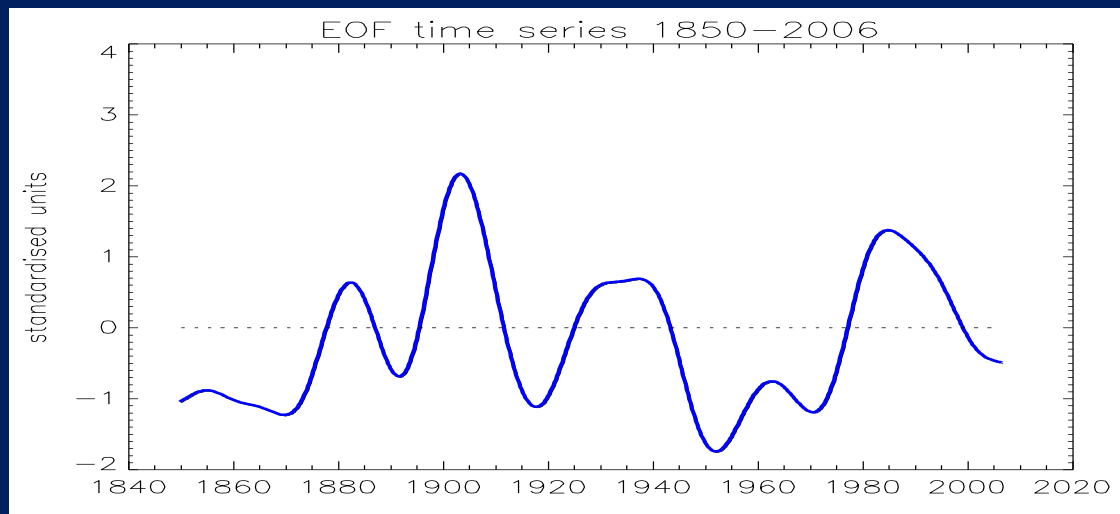

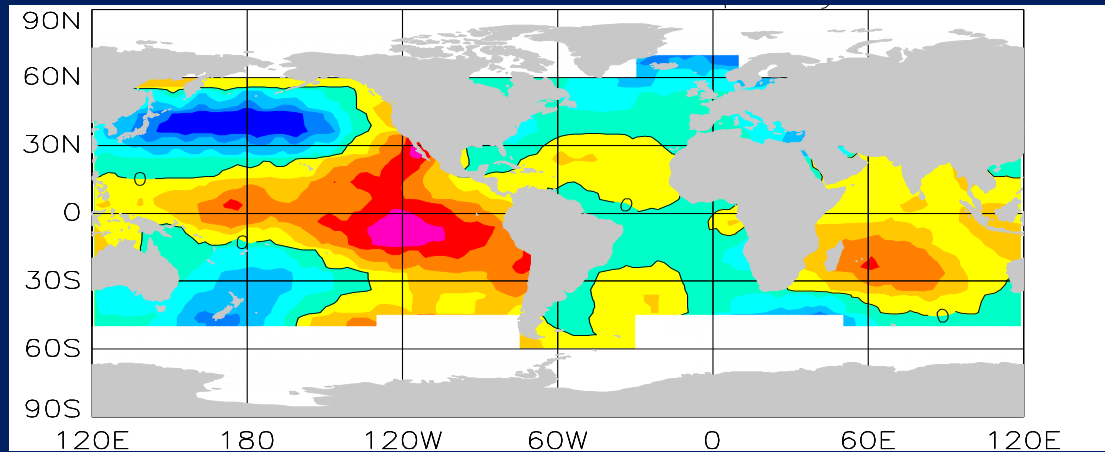

Mei-Yu rainfall (mm/d) 1990-2006

Thank you

Interdecadal Pacific Oscillation , SSTA
